

Instructions for Squaric Acid Immunotherapy for Warts

- 1) Apply with a dropper a small amount to ONE wart ONCE A DAY until mild irritation (redness and itching) develops. This is like “liquid poison oak” so do not get the medication on other parts of your body.
- 2) Once mild irritation occurs, start applying to 3-4 warts at a frequency just enough to maintain a mild reaction for 2-3 months (sometimes, just once or twice a week is enough to maintain the mild irritation).
- 3) The biggest risk is: severe allergic reaction all over (like getting poison oak all over). You will need to call the doctor if this occurs.
- 4) **Tips:**
 - Be patient. It may take 2-3 months for the warts to respond.
 - Keep it out of children’s reach.
 - Do not try to overuse! It may cause a severe reaction.
